

## Task: CSV-Import in Python

Imagine you are starting a new project for your team. Other colleagues **will join** the project after you developed some infrastructure.

Create a new project with **python** and upload the source code to a GitHub repository. Please make sure to bring a link to the next interview.

Your task is to **run a database** of your choice (e. g. using docker) and **import** the file plan.csv.

### Notes:

- The machines from the file should be saved in a separate table
- The start and end dates should be saved in a suitable format
- You can show your result by reading the data from the database and writing it to the console/output.

### Bonus:

- Think carefully about how data and source code is handled in a professional infrastructure and implement this small project accordingly.
